Outline

- Team Projects This Week
- Midterm
- Stratification
 - What is it; Notation
 - Weights and Proportionate Sampling
 - Variances and Design Effect
 - Examples

06 March 2012

3

Team Projects This Week

- II.5 Due Thursday (Blackboard)
 - Include a paragraph or so on your research question
 - Pretest a version of your questionnaire (or observation protocol) on a group of possible respondents/units.
 - Write 2-4 paragraphs: how many respondents/units you used in the pretest; how similar they were to units in the population; and the changes you made in the survey based on this pretest.
 - Include both old and revised questionnaire/protocol
- IRB Form Due Thursday (Blackboard)
 - If you are surveying people, and you have not turned one in to me yet, you need to do this by Thursday.
 - Form at <http://www.stat.cmu.edu/~brian/303>. You don't need to include any attachments
- Peer Evaluations Due Thursday (email to me)
 - Each person should email me forms for all other members of their team, in one email with subject "36303 Peer Evaluations"
 - Form at <http://www.stat.cmu.edu/~brian/303>

06 March 2012

4

Team Projects After Spring Break

- II.6 Project Plan (Tue Mar 20, Blackboard)
 - Final, full project proposal (items A-M on the “designing a sample survey” handout, except don’t include the IRB form [item I]).
 - This should be easy: copy and update the latest thing you have done for each of the items A-M up to now into a single electronic file to submit on blackboard. for each team.
 - From this proposal, anyone outside our class should be able to read and understand completely what you are proposing to do
- Get started Collecting Data!

Stratified Sampling

- Strata are just subgroups of the target population that have some feature in common (gender, major, region, income, ...)
- Why stratify?
 - We need to make a separate inference for each stratum (e.g. we want to estimate men’s and women’s incomes separately)
 - Different sampling schemes would be used in each stratum (PA voters in PA, vs PA voters in Afganistan)
 - Population is geographically diverse (Minnesota, Illinois, Ohio, Pennsylvania)
 - Reduce variance of estimates (and reduce sample size) by exploiting similarity among members of the same stratum

What is Stratification?

Record	Name	Group		Record	Name	Group
1	Bradburn, N.	High		2	Cochran, W.	Highest
2	Cochran, W.	Highest		7	Hunt, J.	Highest
3	Deming, W.	High		11	Madow, W.	Highest
4	Fuller, W.	Medium		12	Mandela, N.	Highest
5	Habermann, H.	Medium		19	Wolfe, T.	Highest
6	Hansen, M.	Low		1	Bradburn, N.	High
7	Hunt, J.	Highest		3	Deming, W.	High
8	Hyde, H.	High		8	Hyde, H.	High
9	Kalton, G.	Medium	→ Kalton, G.	17	Sudman, S.	High
10	Kish, L.	Low		18	Wallman, K.	High
11	Madow, W.	Highest		4	Fuller, W.	Medium
12	Mandela, N.	Highest		5	Habermann, H.	Medium
13	Norwood, J.	Medium	→ Norwood, J.	9	Kalton, G.	Medium
14	Rubin, D.	Low	→ Rubin, D.	13	Norwood, J.	Medium
15	Sheatsley, P.	Low		20	Woolsey, T.	Medium
16	Steinberg, J.	Low		6	Hansen, M.	Low
17	Sudman, S.	High		10	Kish, L.	Low
18	Wallman, K.	High	→ Wallman, K.	14	Rubin, D.	Low
19	Wolfe, T.	Highest		15	Sheatsley, P.	Low
20	Woolsey, T.	Medium		16	Steinberg, J.	Low

Unstratified Sample

Stratified Sample

06 March 2012

8

Some Basic Notation

■ H strata

- N_h = population size in each stratum $N = \sum_{h=1}^H N_h$
- n_h = sample size in each stratum $n = \sum_{h=1}^H n_h$
- $f_h = n_h/N_h$ = sampling fraction, each stratum

■ The population average

$$\bar{y}_{pop} = \frac{1}{N} \sum_{i=1}^N y_i = \frac{1}{N} \sum_{h=1}^H \sum_{i=1}^{N_h} y_{hi} = \sum_{h=1}^H \frac{N_h}{N} \frac{1}{N_h} \sum_{i=1}^{N_h} y_{hi} = \sum_{h=1}^H \frac{N_h}{N} \bar{y}_{h,pop}$$

■ In stratified sampling we mimic this

$$\bar{y}_{st} = \frac{1}{n} \sum_{i=1}^n y_i = \sum_{h=1}^H \frac{N_h}{N} \bar{y}_h \text{ where } \bar{y}_h = \frac{1}{n_h} \sum_{i=1}^{n_h} y_{hi}$$

Weights, and Proportionate Sampling

■ Let $W_h = N_h/N$. Then

$$\bar{y}_{pop} = \sum_{h=1}^H W_h \bar{y}_{h,pop} \text{ and } \bar{y}_{st} = \sum_{h=1}^H W_h \bar{y}_h$$

■ In proportionate sampling we let $f_h = n_h/N_h = f$ for all strata h. Then $n_h/n = N_h/N$ (why??)

- The sample is called “self-weighting”
- Sample mean is “simple” for self-weighting

$$\begin{aligned} \bar{y}_{st} &= \sum_{h=1}^H W_h \bar{y}_h = \sum_{h=1}^H \frac{N_h}{N} \bar{y}_h = \sum_{h=1}^H \frac{n_h}{n} \bar{y}_h = \\ &= \sum_{h=1}^H \frac{n_h}{n} \frac{1}{n_h} \sum_{i=1}^{n_h} y_{hi} = \frac{1}{n} \sum_{h=1}^H \sum_{i=1}^{n_h} y_{hi} = \frac{1}{n} \sum_{i=1}^n y_i \end{aligned}$$

Sampling Variances

(SRS w/o replacement in each stratum)

■ Within each stratum it's the same old answer

$$Var(\bar{y}_h) = (1 - f_h) \frac{s_h^2}{n_h} \text{ where } s_h^2 = \frac{1}{n_h - 1} \sum_{i=1}^{n_h} (y_{hi} - \bar{y}_h)^2$$

■ Then we combine across strata using weights

$$\begin{aligned} (W_h)^2: \quad Var(\bar{y}_{st}) &= Var\left(\sum_{h=1}^H W_h \bar{y}_h\right) \\ &= \sum_{h=1}^H Var(W_h \bar{y}_h) = \sum_{h=1}^H W_h^2 Var(\bar{y}_h) \\ &= \sum_{h=1}^H W_h^2 (1 - f_h) \frac{s_h^2}{n_h} \end{aligned}$$

Design Effect

■ The design effect is a measure of how much better or worse Stratified is than one SRS:

$$d^2 = \frac{Var(\bar{y}_{st})}{Var(\bar{y}_{srs})} = \frac{\sum_{h=1}^H W_h^2 (1 - f_h) \frac{s_h^2}{n_h}}{(1 - f) \frac{s^2}{n}}$$

■ Usually, $d^2 < 1$, i.e. stratified does better than one big SRS!

- Usually best if:
 - Elements are more similar to each other within strata than between (e.g., substantively meaningful strata)
 - Proportionate sampling
- Cochran (1961) suggests 2-6 strata usually give the best results; greater than 6 OK, but there are diminishing returns
